

# Interpreting Long-term Simulations

- Long-term simulations provide illustrations--not precise forecasts--of the relative fiscal outcomes associated with alternative policy paths.
- These simulations are not predictions of what will happen in the future as policymakers would likely take action to prevent damaging out-year fiscal consequences.

# Alternative Fiscal Policy Simulations

- **Baseline extended** follows CBO's January 2008 10-year baseline projections which assume that discretionary spending authority grows with inflation and tax provisions scheduled to expire will actually do so including the temporary increase in the alternative minimum tax (AMT) exemption amount. After 2018, discretionary spending is assumed to grow with the economy, and revenue is held constant as a share of GDP at the 2018 level of 20.3 percent—implicitly assuming that action is taken to offset increased revenue from real bracket creep, the AMT, and tax-deferred retirement accounts. Medicare spending is based on the 2007 Trustees' intermediate projections that assume the continuation of current law under which fees for physicians treating Medicare patients would be cut in future years.
- **Alternative simulation** follows baseline extended except for changes to the assumptions for three variables. Discretionary spending grows with the economy after 2008 and all expiring tax provisions are extended including the 2007 AMT exemption amount. After 2018, revenue is brought back to its 40-year historical average level of 18.3 percent of GDP plus expected revenues from deferred taxes, i.e. taxes on withdrawals from retirement accounts. Throughout the simulation period, Medicare spending is based on the April 2007 Trustee's intermediate projections adjusted for CMS's alternative assumption that physician payments are not reduced as required under current law.
- After the first 10 years, in both simulations
  - Social Security spending is based on the April 2007 Trustees' intermediate projections. Medicaid spending is based on CBO's December 2007 long-term projections adjusted to reflect excess cost growth consistent with the 2007 Trustees' intermediate assumptions for Medicare.
  - Social Security and Medicare benefits are paid in full after the trust funds are exhausted through borrowing from the general fund to meet any payroll tax shortfall.
  - Other mandatory spending is held constant as a share of GDP at the 2018 level.

# Unified Surpluses and Deficits as a Share of GDP Under Alternative Fiscal Policy Simulations

# Total Federal Revenue and Discretionary Spending as Shares of GDP: Historical Averages and GAO's Simulations after 2018

	20-year historical average (percent)	40-year historical average	GAO's Baseline Extended Simulation	GAO's Alternative Simulation
Total Revenue	18.4	18.3	20.3	18.6 <sup>a</sup>
Discretionary spending	7.6	9.1	6.1	7.7

<sup>a</sup>Average over the period from 2019-2082. Represents a return to 40-year historical average level of revenue of 18.3 percent of GDP plus expected revenues from deferred taxes (i.e. taxes on withdrawals from retirement accounts).

Source: Congressional Budget Office and GAO.

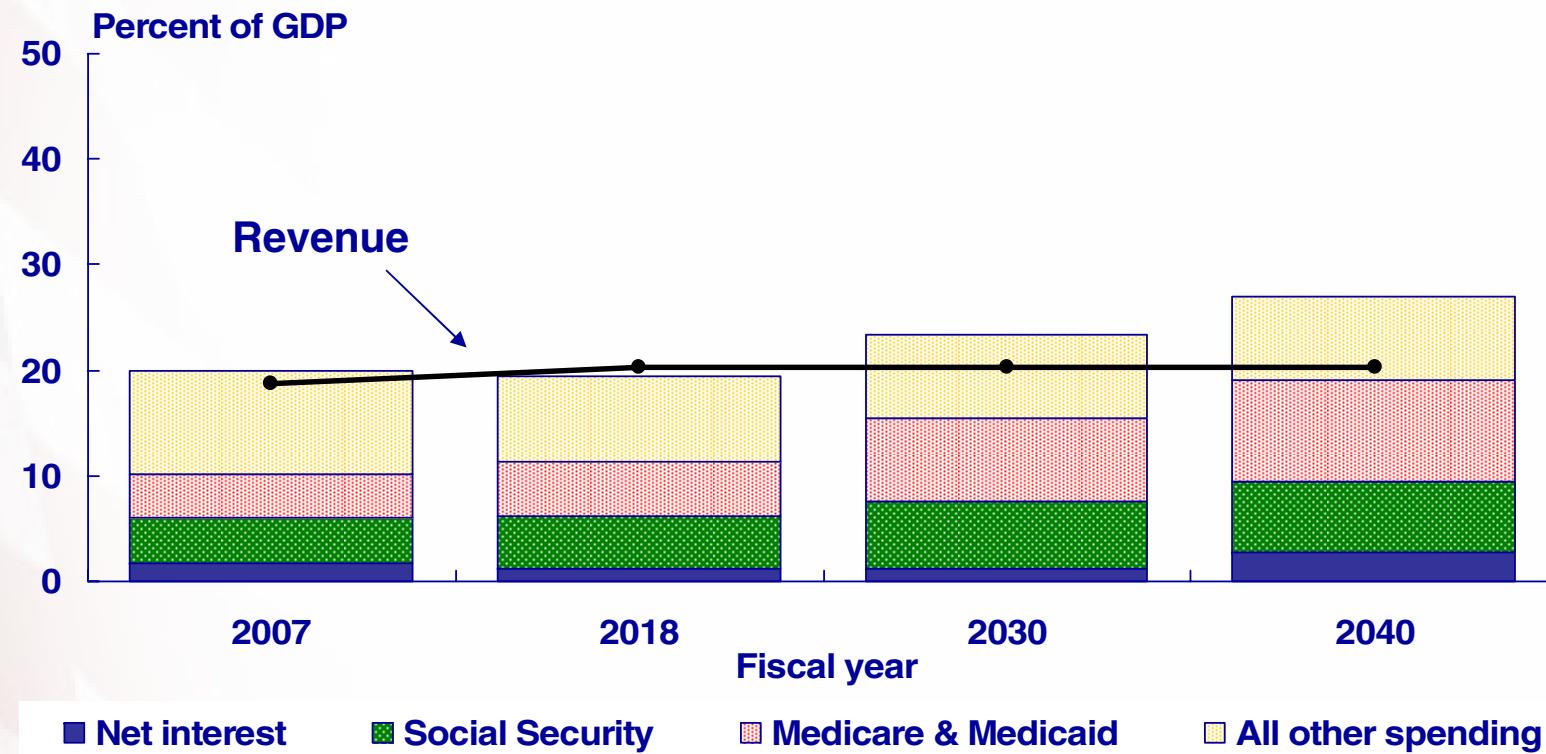

Note: Simulation values represent GAO's ultimate assumptions (year 10 and beyond).

# Debt Held by the Public as a Share of GDP Under Alternative Fiscal Policy Simulations

Source: GAO's January 2008 analysis.

## Potential Fiscal Outcomes Under Baseline Extended Revenues and Composition of Spending as a Share of GDP

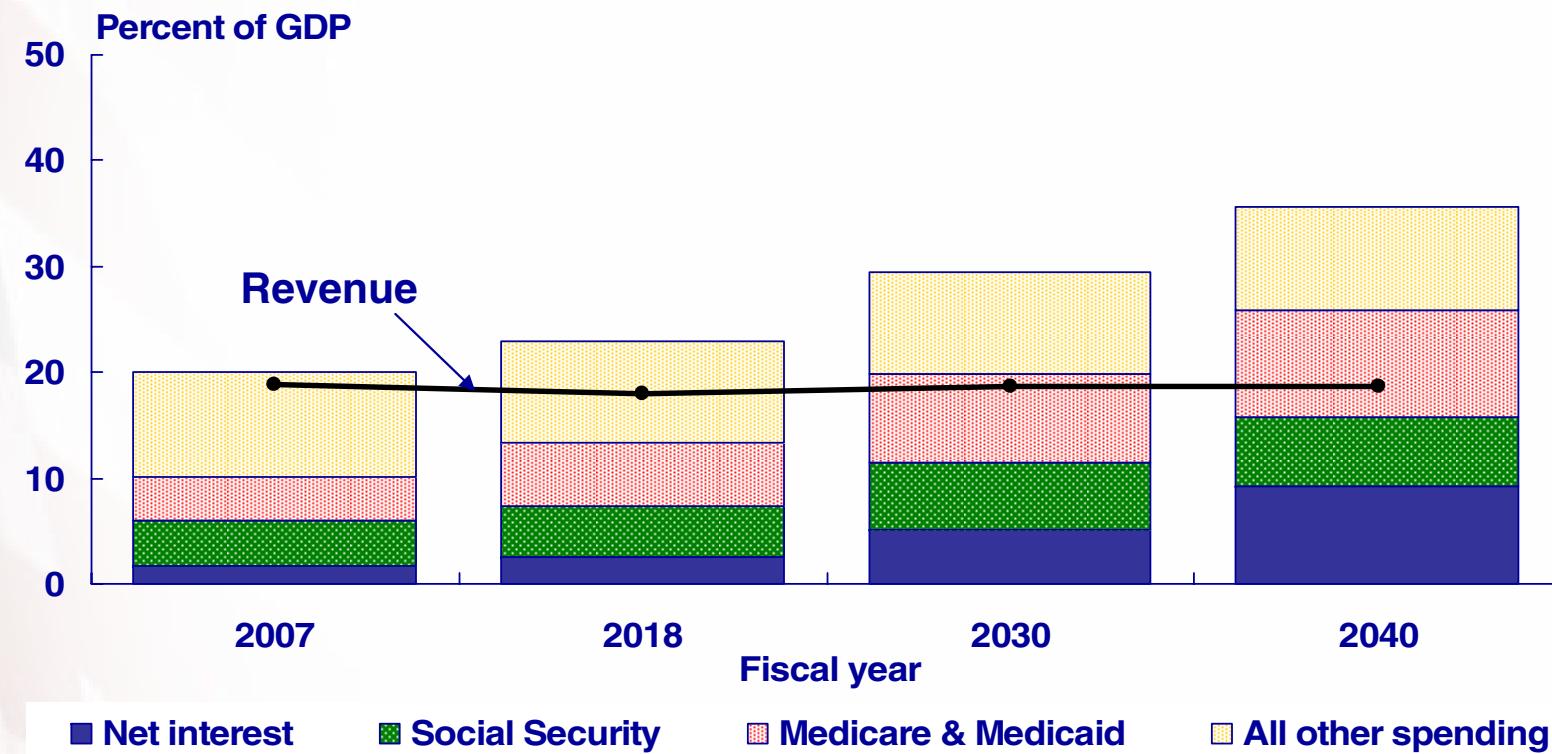

Source: GAO's January 2008 analysis.

Notes: In addition to the expiration of tax cuts, revenue as a share of GDP increases through 2018 mainly due to (1) real bracket creep, (2) more taxpayers becoming subject to the AMT, and (3) increased revenue from tax-deferred retirement accounts. After 2018, revenue as a share of GDP is held constant—implicitly assuming that action is taken to offset increased revenue from real bracket creep, the AMT, and tax-deferred retirement accounts.

# Potential Fiscal Outcomes Under Alternative Simulation

## Revenues and Composition of Spending as a Share of GDP

Source: GAO's January 2008 analysis.

Notes: Discretionary spending grows with GDP after 2008. AMT exemption amount is retained at the 2007 level through 2018 and expiring tax provisions are extended. After 2018, revenue as a share of GDP returns to its historical level of 18.3 percent of GDP plus expected revenues from deferred taxes, (i.e. taxes on withdrawals from retirement accounts). Medicare spending is based on the Trustees April 2007 projections adjusted for the Centers for Medicare and Medicaid Services alternative assumption that physician payments are not reduced as specified under current law.

## Federal Fiscal Gap (2008-2082)

	Fiscal gap Trillions of present value 2008 dollars	Change required to close gap compared to today's levels			Percent decrease in noninterest spending
		Percent increase in today's revenue	Percent increase in today's individual income taxes		
Baseline	\$25.6	3.2%	17.3%	38.1%	17.4%
Extended					
Alternative	55.3	7.0	37.7	82.5	37.3

Source: GAO analysis.

# Key Budget Assumptions

<b>Model inputs</b>	<b>Baseline extended</b>	<b>Alternative</b>
Revenue	CBO's January 2008 baseline through 2018; thereafter remains constant at 20.3 percent of GDP (CBO's projection in 2018)	All expiring tax provisions are extended through 2018; thereafter equal to 40-year historical average of 18.3 percent of GDP plus revenue from tax-deferred retirement plans
Social Security Spending (OASDI)	CBO's January 2008 baseline through 2018; thereafter based on 2007 Social Security Trustees' intermediate projections	Same as Baseline Extended
Medicare spending	CBO's January 2008 baseline through 2018; thereafter 2007 Medicare Trustees' intermediate projections that assume per enrollee Medicare spending grows on average 1 percent faster than GDP per capita over the long term.	2007 Trustees intermediate projections adjusted for the Centers for Medicare and Medicaid Services' alternative assumption of zero percent physician payment updates in the first 10 years.
Medicaid spending	CBO's January 2008 baseline through 2018; thereafter CBO's December 2007 long-term projections adjusted to reflect excess cost growth consistent with the 2007 Medicare Trustees' intermediate projections	Same as Baseline Extended
Other mandatory spending	CBO's January 2008 baseline through 2018; thereafter remains constant as a share of GDP at 1.9 percent of GDP (i.e., increases at the rate of economic growth)	Baseline Extended through 2011, then adjusted for extension of certain tax credits through 2018; thereafter remains constant at 2.0 percent of GDP
Discretionary spending	CBO's January 2008 baseline through 2018; thereafter remains constant at 6.1 percent of GDP	Increases at the rate of economic growth starting after 2008 (i.e., remains constant at 7.7 percent of GDP)

Source: GAO.

# Key Economic Assumptions

Model inputs	All Simulations
Labor: growth in hours worked	2007 Social Security Trustees' intermediate projections
Nonfederal saving: gross saving of the private sector and state and local government sector	Increases gradually over the first 10 years to 18.5 percent of GDP (the average nonfederal saving rate from 1950-2007)
Current account balance (percent of GDP)	From 2007-2018, 2007 share of GDP plus one-third of any change in gross national saving from 2007; thereafter equal to 2018 nominal level plus one-third of any change in gross national saving from 2007
Total factor productivity growth	1.4 percent through 2018 (CBO's January 2008 short-term assumption); 1.4 percent thereafter (long-term average from 1950-2007)
Inflation (percent change in GDP price index)	CBO January 2008 baseline through 2018; 1.9 percent thereafter (CBO's projection in 2018)
Interest rate (on publicly held debt)	Rate implied by CBO's January 2008 baseline net interest payment projections through 2018; 4.9 percent thereafter (the rate implied in 2018)
